SECTION 01

How to Use This Document

This document is a standalone universal admin dashboard specification. Upload it to any Lovable project and it will:

- Audit your entire Supabase schema and existing code
- Detect Content Engine, pSEO Engine, Quality Gateway, Affiliate system, schedulers, etc.
- Build or upgrade a single beautiful command center at /admin
- Wire all systems together intelligently
- Provide one place to manage your entire autonomous content operation

It works on fresh projects or mature ones. Detection mode ensures it never breaks what already works.

INFO

If your Lovable project already has some of these systems partially built from the Content Engine or Programmatic SEO Engine specs, the activation prompt includes full detection logic. It audits what exists, skips anything already working, and only builds what is missing. It will not overwrite or break anything already in your project.

SECTION 02

What This Builds

Component	Description
Modern admin dashboard	Responsive UI at /admin, protected by Supabase Auth. Dark-mode-first, professional sidebar navigation.
Detection engine	Scans your entire Supabase schema on activation and on every login. Finds every system, wires them together.
Unified overview	Real-time widgets showing daily pulse, quality health, content funnel, queue status, top performers, and alerts.
Modular sections	Dynamic menu that only shows sections relevant to detected systems. Nothing clutters the interface unnecessarily.
Smart automation	Cross-system tools that work across all engines: sync, gap detection, bulk operations, health checks.
Aggregated logging	All failure logs, generation logs, quality scores, and indexing status in one searchable place.
Multi-site reporting	Network-wide metrics and alerts when running in multi-site mode.
Clean dark-mode UI	Professional, consistent design language that matches the quality of what it manages.

SECTION 03

Setup -- Three Questions

Before pasting the activation prompt, answer these three questions. Your answers get inserted into the prompt where indicated. This personalises the dashboard to your specific setup.

Question 1 -- Dashboard Identity

What should the dashboard be called? This name appears in the sidebar header, the browser tab, and all email alerts. Use something that identifies your content operation clearly.

Example: "NoCode Reviewed Command Center"

Question 2 -- Site Identity Block

Paste your five-sentence site identity (the same block used in the Content Engine). This is used by the dashboard's AI-powered smart suggestions feature to generate context-aware recommendations about your content operation.

Question 3 -- Operating Mode

Mode	Description
single-site	Default. One Lovable project, one domain. All stats and controls for this site only.
multi-site	Network operator managing multiple properties from one dashboard. Aggregates data from all sites.

SECTION 04

The Lovable Activation Prompt

This is the prompt you paste into Lovable's chat input. Replace the three [BRACKETED] sections with your answers from Section 03. Paste the entire thing as a single message.

IMPORTANT

This prompt uses approximately 2–3 Lovable credits. On the free plan, use this as your main prompt for the day. Save remaining credits for testing and any fixes needed.

Build and activate a complete standalone Universal Smart Admin Dashboard v1.0 for this Lovable project.

First perform full system detection for:

- Content Engine components (articles table, scheduler, generation_log, etc.)
- Programmatic SEO Engine (pseo_pages, tools table, etc.)
- Quality Gateway logic
- Affiliate links system
- Existing admin routes or panels
- All relevant Supabase tables and Edge Functions

For every system found: intelligently integrate and upgrade it into the new dashboard.

For anything missing: build clean, high-quality foundational components.

DASHBOARD NAME: [YOUR DASHBOARD NAME]

SITE IDENTITY BLOCK: [PASTE FIVE SENTENCES HERE]

MODE: [single-site or multi-site]

Build the dashboard at the route /admin, protected by Supabase Auth.

Create a modern, beautiful, responsive interface with:

- Dark mode first, professional sidebar navigation
- Dynamic menu that only shows relevant sections based on detected systems
- Real-time stats and actionable widgets on the homepage
- Full modular section system as described in the specification
- Smart cross-system automation tools
- Aggregated logging, alerts, and analytics
- Multi-site network reporting (if mode = multi-site)

AFTER BUILDING: Provide a build report listing every system detected, every component built, and the URL of the admin panel.

SECTION 05

Detection & Auto-Wiring System

The dashboard includes a powerful detection engine that runs on activation and on every login. It scans your Supabase instance and codebase to identify every active system, then wires them into the dashboard automatically.

What the engine scans for

System signal	Dashboard effect
articles table	Content Engine installed — activates Content section
pseo_pages table	Programmatic SEO Engine installed — activates pSEO section
tools table	Tools database present — activates Tools Manager
keyword_queue table	Content Engine keyword queue — activates Queue Manager
generation_log table	Generation logging active — activates Failure Log
pseo_quality_log	pSEO quality controls active — activates Quality section
affiliate_links table	Affiliate system present — activates Affiliate Manager
Active cron/schedulers	Detects firing times, shows in Schedule section
Quality rules + thresholds	Pulls current settings into Quality Gateway section
network_reports table	Multi-site reporting active — activates Network tab

What detection results in

- Connected systems show a "Connected" status badge with live health metrics
- Detected sections automatically appear in the sidebar navigation
- Pre-configured widgets load with data appropriate to each detected system
- Missing systems show helpful "One-click install" cards pointing to the relevant spec documents

SECTION 06

Universal Dashboard Overview (Homepage)

The dashboard homepage is a command center -- not a settings page. Every widget shows something actionable. Red means something needs attention. Green means the system is running correctly. You should be able to assess your entire content operation in under 30 seconds from this page.

Widget	What it shows
Daily Pulse	Articles + pSEO pages published today and this week. Trend vs same day last week.
Quality Health	Overall gateway pass rate as a percentage. 7-day trend chart. Below 70% shown in amber.
Content Funnel	pSEO impressions → Deep article traffic → Affiliate conversions. Requires GSC token.
Queue Status	Keywords pending in Content Engine queue. pSEO page generations queued. Days of runway remaining.
Top Performers	Combined ranking of best pages by traffic and affiliate clicks. Across both engines.
Active Alerts	Red/yellow/green failure summary. Click any alert to jump to the relevant failure log.
System Health	All engines status at a glance. Last run times. Next scheduled runs. API ceiling status.

SECTION 07

Modular Sections (Auto-Activated)

Core Sections (Always Present)

These sections are built regardless of which engines are detected:

Section	Purpose
Command Center	The homepage dashboard overview. Always the entry point.
Tools Database Manager	Single source of truth for all tools data. Powers both Content and pSEO engines.
Affiliate Link Manager	Table of all affiliate URLs with toggle, click tracking, and default fallback.
Unified Schedule & Automation	All cron jobs and schedulers in one view. Pause, adjust, and manually trigger any engine.
Failure Log + Alerts	Every API failure, gateway rejection, and scheduler error in one searchable log.
Network Reports	Site-level stats. Feeds into multi-site master dashboard if network mode is active.

Content Engine Section

Appears automatically if the Content Engine is detected:

- Generation controls: pause/resume, manual trigger, articles-per-day slider
- Site identity editor: live text area, changes apply to the next run
- Article type rotation toggles: disable any article type you don't want
- Quality gateway controls: threshold slider, banned phrases editor, recent scores
- Keyword queue manager: view, add, reorder, retry failed keywords
- Newsletter settings: schedule, override, preview before send

pSEO Engine Section

Appears automatically if the Programmatic SEO Engine is detected:

- Page counts by type: published, draft, suppressed -- with quality failure reasons
- Generation controls: manual regenerate per tool, bulk regenerate all
- Thin content warnings: pages below quality threshold flagged with fix suggestions
- Bulk actions: suppress, regenerate, or prioritise selected pages
- Indexing status: IndexNow submission queue, GSC confirmation status
- Top performing pSEO pages: sorted by impressions when GSC token is available

Quality Gateway Section

Appears when Quality Gateway logic is detected in either engine:

- Global pass threshold: single slider controls both Content and pSEO engines
- Per-system rules: fine-tune thresholds independently for articles vs pSEO pages
- Banned phrases editor: add or remove phrases that trigger gateway rejection
- Scoring analyzer: last 20 scored items with per-dimension breakdowns
- Consistently weak dimensions are highlighted so you can address root causes

SECTION 08

Smart Cross-System Features

These features exist only because both engines share the same dashboard. They would not be possible managing each engine separately. They are the highest-leverage tools in the entire system.

Feature	What it does
Sync Tools ↔ Content	Updates tools table from new articles. Adds newly reviewed tools automatically. Bidirectional.
Find Content Gaps	Shows high-potential pSEO pages (high impressions, no deep review) that should become Content Engine articles.
Promote to Full Article	One-click: sends a strong pSEO page directly to the Content Engine keyword queue with high priority.
Bulk Regenerate	Refresh stale pSEO pages or Content Engine articles that have not been updated in 90+ days.
Health Check	Full system audit button. Checks every table, every scheduler, every API connection. Returns a status report.
Smart Suggestions	AI-powered recommendations based on your data. Examples: "47 comparison pSEO pages without deep reviews" or "Queue runs empty in 8 days."

INFO

Smart Suggestions calls the Gemini API once per day to analyse your content operation and surface the highest-value action you could take. It reads your `network_reports` data, your queue depth, your quality scores, and your top performers to generate context-aware advice. This is the only part of the dashboard that uses an API call -- everything else reads from Supabase directly.

SECTION 09

Quality Gateway Integration

The dashboard becomes the single control center for the Centralized Quality Gateway that governs both the Content Engine and the Programmatic SEO Engine. Changes made here apply to both systems simultaneously, unless per-system overrides are configured.

What you can control

- Scoring dimensions and weights -- adjust how much each dimension contributes to the final score
- Pass thresholds per content type -- stricter for full articles, more flexible for pSEO pages if desired
- Recent scores with explanations -- see exactly why each piece of content passed or failed
- Banned phrases globally -- one list governs both engines; changes apply to the next generation run
- Retry queue -- manually trigger a retry for any content that failed the gateway

Default scoring dimensions

Dimension	Points	What is checked
Specificity	20 pts	Names specific use cases, users, and scenarios. Generic benefits score zero.
Verdict clarity	20 pts	Clear recommendation present. Who to use it for. Who to avoid it.
Original angle	15 pts	Non-obvious perspective. Not a vendor feature list restated.
Limitations	15 pts	Genuine cons acknowledged. Substantive rather than softened.
Structure	15 pts	Logical flow. Scannable headers. Tight content scores higher than padded filler.
No banned phrases	15 pts	Zero instances of banned phrases. One instance deducts 8 points.

SECTION 10

Multi-Site Network Mode

When activated in multi-site mode, the dashboard turns into a central hub for your entire content network. Instead of checking each site's admin panel separately, all data flows into one view.

What multi-site mode enables

- Aggregate data from multiple Lovable projects via a shared Supabase `network_reports` table
- Compare content performance, quality scores, and affiliate clicks across all sites
- Manage global affiliate links and quality standards that apply network-wide
- Show network-wide metrics: total articles published today, combined affiliate clicks, lowest queue depth

- Highlight sites in distress: amber for queue below 10 keywords, red for failures today

How each site reports

Field	Description
site_id	Unique identifier set via SITE_ID environment variable in each Lovable project
run_date	Timestamp of when the generation run completed
articles_published	Count of articles published in this run
articles_failed	Count of articles that failed after three-strike retry
gateway_pass_rate	Percentage of articles that passed quality check (decimal 0.0–1.0)
keywords_remaining	Queue depth at time of report — how many keywords left to write
pseo_page_count	Total published pSEO pages on this site (from pSEO engine)
affiliate_clicks	Clicks tracked since last report period
next_run_scheduled	When the next generation run is due to fire

SECTION 11

Database Schema & Reporting

The activation prompt creates or extends these tables. Existing tables are never overwritten -- only missing columns are added.

New tables created by this spec

Table	Purpose
dashboard_settings	Single-row table. Stores dashboard name, mode, site identity, theme preferences.
network_reports	Extended from Content Engine. Adds pseo_page_count and dashboard_last_viewed fields.
system_health_log	Timestamped health check results. Each "Health Check" button run writes one row.
smart_actions_log	Log of all Smart Suggestion actions taken via the dashboard. Audit trail.

Reporting hierarchy

All stats flow in one direction: individual engine logs → dashboard aggregation → network_reports → multi-site master dashboard. You never need to query Supabase directly to understand what your content operation is doing.

SECTION 12

Security & Access Control

Control	Detail
Supabase Auth	All /admin routes are protected. Unauthenticated requests redirect to login. Magic link recommended.
Role-based access	Admin: full control. Editor: content and keywords only. Viewer: read-only stats.
Audit log	Every admin action is logged with timestamp, user ID, and action type. Viewable under Settings.
Session timeout	Inactive sessions expire after 2 hours. Configurable in dashboard_settings.
API key protection	All API keys stored as Supabase Edge Function environment variables. Never exposed to the client.
Row-level security	Supabase RLS policies applied to all tables. Users can only see their own site's data.

SECTION 14

Troubleshooting

Dashboard not loading at /admin

- Check that Supabase Auth is configured in your Lovable project settings
- Verify the /admin route was created -- it should redirect unauthenticated users to /login
- Check the Lovable build log for errors during the activation prompt run
- Use the follow-up prompt: "The /admin route is not loading. Fix routing and confirm Supabase Auth protection."

Systems not being detected

- Open Supabase and confirm the relevant tables exist (articles, pseo_pages, tools, etc.)
- Detection runs on every login -- log out and back in to force a re-scan
- Tables created by other specs may have slightly different names -- check the detection log in the build report
- Run the Health Check button on the dashboard homepage to force a full re-audit

Smart Suggestions not appearing

- Smart Suggestions require GEMINI_API_KEY to be set in environment variables
- Suggestions are generated once per day at midnight UTC -- they will not appear until the first run completes
- Check the smart_actions_log table in Supabase for error messages

Multi-site mode showing no data from other sites

- Confirm all sites have the same Supabase project configured (shared database required)
- Verify SITE_ID is set to a unique value on each site
- Check network_reports table -- rows from each site should appear after each generation run
- Each site must have the Content Engine installed and running to report to network_reports

IMPORTANT

Before spending a Lovable credit on a fix prompt, always check the `system_health_log` table in Supabase directly. The health check writes detailed error messages that are more specific than what appears in the dashboard UI. Most issues can be diagnosed and fixed with a targeted follow-up prompt of under 20 words once you know the exact error.

Network Backlink Manager

The Network Backlink Manager lets you register every domain you own and intelligently creates, maintains, and optimises backlinks between them. Internal network links are the highest-quality backlinks you can get: you control the anchor text, the placement, the relevance, and the timing. This module manages all of that autonomously.

INFO

A well-linked network of topically related sites compounds authority over time. A deep Bubble review on Site A gains more trust when a topically relevant "Best No-Code Tools" page on Site B links to it -- and vice versa. This module automates exactly that, at scale, safely.

Domain Registration & Relevance Scoring

Register any domain you own. The system reads its site identity block and existing content to build a topical profile. That profile is used to score relevance between pages across different sites before any link is suggested or inserted.

Field	Purpose
domain	The full domain (e.g. nocoderreviewed.com). One row per site.
site_identity_block	Five-sentence identity. Same format as Content Engine. Drives relevance scoring.
primary_topics	Auto-extracted from site_identity_block and existing articles. Used for matching.
site_id	Must match the SITE_ID environment variable on that Lovable project.
active	Toggle off to exclude a site from all backlink operations without deleting registration.
authority_tier	Set manually: 1 = anchor site (highest authority), 2 = supporting, 3 = new/thin. Affects link flow direction.

Relevance Scoring Between Pages

Before any link is suggested or inserted, the system scores the relevance between the linking page and the target page on a 0–100 scale. Links below the threshold are never inserted.

Dimension	Weight	What is scored
Topic overlap	40 pts	Shared primary topics between source and target pages
Keyword co-occurrence	25 pts	Target keyword mentioned naturally in source page body
Category match	20 pts	Source and target in same or adjacent content category
Audience match	15 pts	Same reader type inferred from site identity blocks

INFO

Default relevance threshold is 65/100. Raise to 75+ for conservative, highly topical networks. Lower to 55 only for broad-topic sites where loose relevance is acceptable. Threshold is configurable per site pair in the admin panel.

Link Insertion Rules

Links are inserted automatically during Content Engine article generation and pSEO template assembly. They can also be inserted into existing published content during the weekly refresh run. These rules govern how and where links appear.

Link type	Rules
Contextual in-content	Inserted within article body where keyword naturally appears. Highest SEO value. Max 2 per article.
See Also / Related Tools	Appended as a structured section at the end of relevant articles. Max 3 links per section.
Category hub links	Best-of and category pages link to deeper reviews on specialist sites. Auto-inserted during pSEO generation.
Author box / site network	Optional footer component listing your network. Activated via UX Builder component. Toggle in admin.
Sidebar / footer network	Static placement. Lowest SEO weight. Useful for brand discovery. Configurable per site.

Hard limits (always enforced, never overridden):

- Maximum 3 cross-network links per page across all link types combined
- Never link from a lower-authority site to a higher-authority site on the same topic (avoids dilution)
- Minimum 400 words of body content before any link is inserted into an article
- No more than 1 link to any single external domain per page
- Links only to domains explicitly registered in the network_domains table

Broken Link Monitoring & Auto-Repair

Every cross-network link is checked weekly. The scanner fetches each target URL and logs the HTTP response. Broken links are repaired automatically where possible; unresolvable links are flagged for manual review.

HTTP status	Auto-repair action
200 OK	Link healthy. No action.
301/302 redirect	Auto-repair: update stored URL to final destination. Log change.
404 Not Found	Auto-repair attempt: search articles table for replacement page on same topic. If found, update link. If not found, remove link and add keyword back to Content Engine queue.
500 / timeout	Retry 3x over 24 hours. If still failing, flag as broken in admin panel. Send alert if ALERT_EMAIL is set.
Domain unreachable	Mark entire domain as degraded. Suspend all outbound links to that domain. Alert operator.

Link Velocity & Safety Controls

Sudden spikes in new backlinks -- even internal ones -- can look unnatural to search engines. The velocity controls ensure link building ramps up gradually and maintains a natural pattern over time.

Site stage	Velocity limit
New site (<90 days)	3 new cross-network links per week maximum across all pages

Site stage	Velocity limit
Established site (90–365 days)	10 new cross-network links per week maximum
Mature site (365+ days)	25 new cross-network links per week maximum
Manual override	Admin can approve up to 2x the weekly limit for a single week (e.g. after a major site launch)
Rotation	Existing links are periodically reviewed and low-relevance ones replaced with higher-relevance alternatives

IMPORTANT

If you receive a Google Manual Action for unnatural links: go to Network Backlink Manager > Safety Controls > Emergency Pause. This immediately suspends all cross-network link insertion and generates a disavow file for all links added in the last 90 days. Do not delete the links manually -- let the disavow file handle it.

Network Link Graph Dashboard

The admin panel includes a visual representation of your network link graph -- which sites link to which, how many links each site sends and receives, and where authority is flowing. This is the primary tool for identifying gaps and imbalances in your network structure.

View	What it shows
Link count by site pair	Table showing how many active links exist from Site A to Site B and vice versa
Authority flow indicator	Which direction authority is predominantly flowing. Red = imbalanced. Green = healthy bidirectional flow.
Relevance score distribution	Histogram of all active link relevance scores. Tail of low-relevance links is an early warning signal.
Top linked pages	Your most-linked-to pages across the entire network. These are your highest-authority assets.
Link gap report	Pages that should have cross-network links (by relevance score) but do not yet. Prioritised opportunity list.
Strengthen Network button	One-click campaign: builds topical link clusters across up to 3 selected sites using the next weekly velocity budget.

Integration Points

System	Integration
Content Engine	During article generation, Gemini is prompted to include natural cross-network link opportunities. Links are scored and inserted if above threshold before publish.
pSEO Engine	Category best and comparison templates include a "From our network" section. Auto-populated with relevant cross-site pages.
Content Refresh Agent	Weekly refresh scans existing articles for new link opportunities added since last run. Inserts new links up to the velocity limit.
Smart Suggestions	Daily Gemini analysis includes network link gap recommendations: "Site B has 12 pages about Zapier. Site A has no links to them."

System	Integration
Failure Log	All broken link detections and repair attempts are written to the main failure log for unified visibility.

Database Schema

Tables created by this module:

Table	Key fields
network_domains	id, domain, site_id, site_identity_block, primary_topics (text[]), authority_tier (int), active (bool), registered_at, last_scanned
network_links	id, source_domain, source_url, target_domain, target_url, link_type, anchor_text, relevance_score, inserted_at, last_checked, status (active/broken/removed)
network_link_log	id, link_id (fk), event_type (inserted/repaired/removed/broken), old_url, new_url, logged_at, auto_resolved (bool)
network_velocity_log	id, site_id, week_start, links_inserted, links_removed, velocity_limit, logged_at

INFO

The network_domains table is the master registry. Every domain you want to participate in cross-linking must have a row here. Sites not in this table are completely excluded from all backlink operations -- even if they share the same Supabase instance.

Environment Variables Checklist

Variable	Where to get it	Required?
GEMINI_API_KEY	aistudio.google.com	YES — if using Smart Suggestions
RESEND_API_KEY	resend.com	Recommended — for email alerts
ALERT_EMAIL	Your email address	Recommended
SITE_ID	A short unique name: e.g. "command-center"	YES — in multi-site mode
SUPABASE_URL	Your Supabase project URL	Already set by prior specs
SUPABASE_ANON_KEY	Your Supabase anon key	Already set by prior specs

Drop this document into any Lovable project. Answer three questions. Paste one prompt. Walk away.

Autonomous Smart Admin Dashboard -- Stupid People Edition · v1.1 · May 2026
