

# The No-Code Empire

## Full Build Plan — Content Networks, AI Agents & Income Projections

Prepared May 2026 · Confidential

**10**

niche sites

**14,400+**

articles / year

**\$2M+**

acquisition potential

**\$180–390**

monthly running cost

## Executive Summary

This document outlines a complete, actionable plan to build a network of 10 complementary no-code and AI-tools review sites, powered by autonomous content generation, a proprietary cross-linking agent swarm, and strategic expired-domain acquisition. The result is a compounding SEO asset with realistic income potential of \$55,000–\$90,000/month by month 12 and an acquisition value exceeding \$2,000,000 at month 18 — on operating costs under \$500/month.

### The core insight

Autonomous content at scale (14,400 articles/year across 10 sites) combined with genuinely valuable tools and tutorials — not thin AI filler — creates a content moat that compounds faster than any individual competitor can match manually. The quality gateway is the single most important element of the entire system.

| <b>12. Build Order &amp; 90-Day Plan</b> | Exact execution sequence                    | → |

## What it is

A professional review and comparison site for no-code building platforms — currently featuring 8 tools, with autonomous article creation running at 4 articles/day (120/month). The site is already live and generating content, making it the proven template for the entire network.

## Current status

| Attribute       | Detail                                             |
|-----------------|----------------------------------------------------|
| Platform        | Lovable (no-code app builder)                      |
| Content engine  | Autonomous — 4 articles/day via Gemini API         |
| Quality gateway | Active — filters thin/duplicate content            |
| Tools listed    | 8 (target: 50+ within 60 days, 200+ by month 6)    |
| Newsletter      | Weekly autonomous issue — proof the pipeline works |
| Monetisation    | Affiliate links + sponsored listing slots planned  |

## Why the anchor site matters

Every other site in the network feeds traffic back here and draws authority from it. The anchor site should reach 50 tools before any companion site launches — depth of coverage is what earns topical authority in Google's eyes and makes the site a genuine reference, not a thin directory.

## Immediate priorities

- Expand tool database from 8 → 50 within 60 days. Each listing needs: full review, pros/cons, pricing breakdown, use-case fit, and an affiliate link.
- Apply to all relevant affiliate programs now — Jasper, Notion, Zapier, Bubble, Webflow, Framer, Glide, Softr, Airtable, Make. Some (ShareASale, Impact) take 2–4 weeks to approve.
- Set up sponsored listing infrastructure. Even with 500 visitors/month, a professional-looking site can sell 1–2 sponsored slots at \$149–299/month each.
- Configure Google Search Console and connect it to the agent pipeline for future keyword targeting.

## 2. The Full 10-Site Network

Niches, Tools & Tutorials

Each site must be a standalone, genuinely valuable resource. The cross-links between sites are a bonus — not the foundation. Every site needs real tools, real tutorials, and a real reason for a reader to bookmark it.

### 1. No-Code Platform Reviews *ANCHOR SITE*

**Tools:** Platform comparison wizard, pricing calculator, feature matrix

**Tutorials:** Full platform deep-dives, beginner to advanced walkthroughs

### 2. AI Automation & Workflow *nocode-automate.com*

**Tools:** Automation cost calculator (Zapier vs Make vs n8n), trigger/action library, flow template generator

**Tutorials:** Zapier vs Make vs n8n full comparison, multi-step automation builds, error handling

### 3. No-Code Database & Backend *nocode-backend.com*

**Tools:** Visual schema builder, Supabase vs Airtable comparison matrix, API endpoint tester

**Tutorials:** Supabase for beginners, when to use Airtable vs a real DB, connecting apps to backends

### 4. No-Code for Ecommerce *nocode-ecommerce.com*

**Tools:** Platform picker quiz (10 questions → recommendation), transaction fee calculator, app stack recommender

**Tutorials:** Shopify vs Wix vs Squarespace vs Webflow, building a store in a weekend, automating fulfillment

### 5. No-Code AI Integration *nocode-ai.com*

**Tools:** AI feature selector, prompt template library, OpenAI vs Gemini vs Claude cost calculator

**Tutorials:** Adding AI chat to Bubble apps, generating content automatically, connecting AI APIs without code

### 6. No-Code for Agencies *nocode-agency.com*

**Tools:** AI client proposal generator, project scope estimator, white-label tool finder

**Tutorials:** Building client sites with Webflow, client handoff workflows, pricing no-code services

### 7. No-Code Analytics & SEO *nocode-analytics.com*

**Tools:** GA4 setup checklist generator, Core Web Vitals explainer, SEO audit checklist builder

**Tutorials:** Google Analytics without a developer, improving page speed on Webflow/Framer, rank tracking

## 8. No-Code for SaaS Founders *[nocode-saas.com](https://nocode-saas.com)*

**Tools:** SaaS pricing page builder, MRR calculator, churn predictor, Stripe integration guide by platform

**Tutorials:** Building SaaS with Bubble from scratch, adding subscriptions without code, scaling past 1,000 users

## 9. No-Code Design & UI *[nocode-design.com](https://nocode-design.com)*

**Tools:** Color palette generator, font pairing tool, component library browser by platform

**Tutorials:** Design principles for non-designers, building beautiful dashboards, choosing UI kits

## 10. No-Code for Solopreneurs *[nocode-solopreneur.com](https://nocode-solopreneur.com)*

**Tools:** Project idea validator, monetisation strategy picker, MVP scope reducer, income calculator

**Tutorials:** First no-code project guide, idea to live in a weekend, making your first dollar online

Natural user journey through the network: Anchor site (platform reviews) → AI Integration site (add AI to what they built) → SaaS site (monetise it) → Analytics site (track growth) → Agency site (sell it as a service). Each site is a genuine destination. Links follow the reader's natural next question.

### 3. Technology Stack & Costs

What runs everything and what it costs

#### Per-site monthly costs (anchor site today)

| Cost Item                 | Amount                                   |
|---------------------------|------------------------------------------|
| Lovable Pro subscription  | \$20–50/month (platform + hosting)       |
| Gemini API — 120 articles | \$0.05–\$2/month (Flash-Lite to 2.5 Pro) |
| Lovable Cloud backend     | \$0–25/month depending on traffic        |
| Domain registration       | ~\$12/year (~\$1/month)                  |
| Total — 1 site            | \$21–78/month                            |

#### Full network monthly costs (all 10 sites + agent swarm)

| Cost Item                              | Amount               |
|----------------------------------------|----------------------|
| 10× Lovable subscriptions              | \$200–500/month      |
| Gemini API — 1,200 articles/month      | \$0.50–\$20/month    |
| 10× domains                            | ~\$10/month          |
| n8n (automation orchestration)         | \$20–50/month        |
| Keyword/rank monitoring (Nightwatch)   | \$50–100/month       |
| Buffer/Typefully (social distribution) | \$20–50/month        |
| Expired domain purchases (one-time)    | \$2,000–20,000 total |
| Total ongoing (excl. domain purchases) | \$300–730/month      |

##### Key insight on Gemini costs

At 1,200 articles/month across 10 sites, Gemini Flash-Lite costs under \$1/month. Even on Gemini 2.5 Pro the total is under \$20/month. The content engine is essentially free at this volume. The real costs are platform subscriptions and monitoring tools.

#### Gemini model selection guide

| Model                 | Price (input/output)         | Best for                               |
|-----------------------|------------------------------|----------------------------------------|
| Gemini 2.5 Flash-Lite | \$0.10/\$0.40 per 1M tokens  | High-volume articles, standard reviews |
| Gemini 2.5 Flash      | \$0.30/\$2.50 per 1M tokens  | Longer deep-dive articles, comparisons |
| Gemini 2.5 Pro        | \$1.25/\$10.00 per 1M tokens | Complex analysis, flagship content     |

Important: As of April 1 2026, Google restricted Pro models behind a paywall on the free tier. Verify your pipeline is running on a paid API key and check Google AI Studio for current rate limits.

### The content volume advantage

120 articles/month per site × 10 sites = 1,200 articles/month = 14,400/year. Most competitors in these niches publish 4–8 articles per month manually. This operation laps them within 60 days on content volume alone. The critical differentiator: every article must genuinely help a reader make a decision.

### The quality gateway — your most important asset

#### Why this matters above everything else

Google's March 2024 helpful content update wiped out hundreds of AI-content networks. The sites that survived had one thing in common: content that genuinely satisfied search intent. The quality gateway is not optional — it is the difference between a \$2M asset and a banned domain.

#### Your quality gateway should enforce:

- ✓ Does this article answer the specific question someone searching this keyword would have?
- ✓ Is there at least one concrete, actionable recommendation a reader can act on today?
- ✓ Does it avoid generic filler phrases ('In today's digital landscape...', 'As we can see...')?
- ✓ Are all tool pricing and feature claims factually accurate and up to date?
- ✓ Is the article's voice distinct from every other article on the same site (no drift)?
- ✓ Does it meet minimum word count for the article type (800+ for reviews, 1,200+ for comparisons)?

### Content types by priority

| Article type          | Strategic value                                                              |
|-----------------------|------------------------------------------------------------------------------|
| Tool comparison       | Highest buyer intent. 'Zapier vs Make for ecommerce' = someone about to buy. |
| Best X for Y list     | Strong traffic. 'Best no-code tools for agencies' captures broad intent.     |
| How-to tutorial       | Long-tail traffic. Builds trust, low bounce rate, good for backlinks.        |
| Tool deep-dive review | Affiliate conversion. Reader is evaluating — hit them with affiliate CTA.    |
| Alternatives to X     | Captures competitor traffic. 'Bubble alternatives' = Bubble's audience.      |
| Beginner guide        | Top of funnel. Introduces site to new audience, builds email list.           |

## Voice differentiation across sites

Each of the 10 sites needs its own Gemini system prompt establishing a distinct voice. The agency site should sound authoritative and business-focused. The solopreneur site should sound personal and encouraging. The SaaS site should sound technical and precise. Identical voice patterns across all 10 sites is a footprint Google can detect — and will.

## Expired domain acquisition

This is the single highest-leverage move in the entire plan. New domains sit in Google's 'sandbox' for 3–6 months regardless of content quality. An expired domain with existing authority skips this entirely — you inherit domain age, backlink profile, and trust signals. A good expired domain can compress a site's ranking timeline from 6 months to 4–6 weeks.

### What to look for in an expired domain

- Ahrefs Domain Rating (DR) 30+ — anything lower rarely provides meaningful benefit
- Backlinks from topically relevant sites — a cooking blog's backlinks won't help an AI tools site
- No manual penalty history — check Google Search Console if you can access it; use archive.org to review historical content
- Clean spam score — Moz Spam Score under 5%, SEMrush Toxic Score under 45
- Historical relevance — domain should have previously covered technology, software, or productivity topics
- Age 3+ years — older domains carry more trust signal weight

### Where to find expired domains

| Source             | Notes                                                                                      |
|--------------------|--------------------------------------------------------------------------------------------|
| ExpiredDomains.net | Free. Large database, noisy. Filter by DR, niche keywords in backlinks.                    |
| ODYS Global        | Premium (\$2,000–\$10,000/domain). Pre-vetted, relevant, ready to use. Worth it for anchor |
| GoDaddy Auctions   | Mid-range. Good volume. Set up alerts for keywords in your niches.                         |
| Spamzilla          | Paid tool (~\$67/month). Best filtering. Connects to Majestic + Moz for clean results.     |

### Budget guidance per site

| Site tier                            | Domain budget                                                   |
|--------------------------------------|-----------------------------------------------------------------|
| Anchor site                          | \$2,000–5,000 (ODYS or premium auction — this one matters most) |
| High-value companions (agency, SaaS) | \$1,000–3,000 each                                              |
| Standard companions                  | \$200–800 each (ExpiredDomains.net finds)                       |
| Total network budget                 | \$8,000–25,000 one-time investment                              |

## On-page SEO — what Lovable handles vs what you handle

|                               |                                                                                               |
|-------------------------------|-----------------------------------------------------------------------------------------------|
| Lovable handles automatically | Clean URLs, meta tags, og tags, sitemap generation, page speed basics, mobile responsiveness  |
| You must configure            | Google Search Console verification, structured data/schema markup for tool reviews, canonical |
| Content pipeline handles      | Keyword targeting in titles/H1s, natural keyword density, internal linking within each site   |
| Agent swarm handles           | Cross-site linking, rank monitoring, content refreshes when rankings drop                     |

### Critical distinction

A Private Blog Network (PBN) — sites that exist primarily to link to each other with no independent value — gets penalized and delisted. This network is different: each site must earn its traffic independently. The cross-links are contextual, natural, and follow the reader's actual journey. That difference is everything.

## The rules for safe cross-linking

### Links must be contextual

Every cross-link appears within article body text where it genuinely helps the reader. Never in footers, sidebars, or link blocks.

### One link per article maximum

Each article links to at most one other network site. Uniform linking patterns across many articles is a detectable footprint.

### Relevance is mandatory

An automation article linking to the automation site = natural. An automation article linking to the design site = forced. Only link when the topic genuinely overlaps.

### Vary anchor text

Never use the same anchor text phrase twice. Use natural variations: 'this comparison', 'our guide to X', 'the full breakdown here'.

### Separate infrastructure

Each site on its own Lovable project, its own domain, ideally different nameservers. Shared hosting IPs are the #1 footprint signal.

### Log every link

The Interlink Agent maintains a database of all cross-links. No site should link to the same destination more than 3 times per month.

## Natural link flow map

| From site                | Links naturally to                 | Reason                                                       |
|--------------------------|------------------------------------|--------------------------------------------------------------|
| No-Code Reviews (anchor) | All 9 companion sites              | Sidebar 'related resources' + in-article contextual          |
| AI Automation            | No-Code Backend, AI Integration    | Automation needs a backend; AI tools need integration guides |
| No-Code Ecommerce        | No-Code Analytics, No-Code Design  | Stores need tracking; stores need good design                |
| No-Code for Agencies     | No-Code SaaS, No-Code Reviews      | Agencies build SaaS products; need platform comparisons      |
| No-Code SaaS             | No-Code Backend, No-Code Analytics | SaaS needs databases; SaaS needs analytics                   |
| Solopreneurs             | No-Code Reviews, AI Integration    | Beginners start with platform reviews; then want AI features |

## 7. The Agent Swarm

6 autonomous agents running the operation

The agent swarm is what turns this from a job into an asset. Once built, it handles keyword research, content creation, cross-linking, rank monitoring, monetisation optimisation, and social distribution — across all 10 sites — without daily intervention. n8n (or Make) acts as the central nervous system connecting all agents.

### Agent 1: The Keyword Scout

\$50–120/month

Runs daily across all 10 sites. Monitors Google Search Console for keywords sitting at positions 8–20 (easiest wins), identifies trending topics before they peak, and generates enriched content briefs dropped into the publishing queue.

*Tools: Google Search Console API, Ahrefs API, Gemini for brief generation, n8n scheduler*

### Agent 2: The Content Engine

~\$20/month

Already built and running. Takes briefs from Agent 1, generates articles via Gemini, passes through the quality gateway, and publishes. Upgrade: feed competitor analysis so each article is written to beat a specific ranking page, not just cover a topic.

*Tools: Gemini API, quality gateway (custom), Lovable CMS webhook, n8n*

### Agent 3: The Interlink Architect

\$20–50/month

Triggered by every new article publish across the network. Scans all other sites for contextually relevant articles, inserts a natural in-content link where appropriate, and logs it to a Supabase database to prevent over-linking. This is the backlink machine running on autopilot — legitimately.

*Tools: n8n webhook, Supabase link database, Gemini for contextual relevance scoring*

### Agent 4: The Rank Monitor

\$50–100/month

Always-on analyst watching all 10 sites. Detects ranking drops, flags content decay, identifies technical regressions. When a page drops more than 5 positions, automatically triggers Agent 2 to refresh the article with updated information and expanded coverage.

*Tools: Nightwatch NightOwl or MEGA AI, Google Search Console API, n8n alert system*

### Agent 5: The Monetisation Optimizer

\$20–50/month

Monitors which articles drive traffic but fail to convert on affiliate links. Tests CTA placement and copy variants. Tracks affiliate commission rate changes. Flags sponsored listing slots that are underpriced relative to current traffic levels.

*Tools: Custom Lovable dashboard, affiliate network APIs, n8n, Google Analytics API*

## Agent 6: The Distribution Agent

\$20–50/month

Every published article gets automatically repurposed into: a LinkedIn post, a Twitter/X thread, a Reddit comment draft, and a newsletter snippet. Posts are either auto-published or queued for one-click approval. Social signals accelerate indexing and drive early traffic before SEO kicks in.

*Tools: Buffer or Typefully API, n8n, Gemini for format adaptation*

## Build order for the swarm

Don't build all 6 agents simultaneously. Agent 2 (content) is already running. Build in this sequence:

1. Agent 3 (Interlink Architect) — unique to your network, immediately valuable, builds on Supabase
2. Agent 4 (Rank Monitor) — protecting what you build is more valuable than building faster
3. Agent 1 (Keyword Scout) — upgrades content quality with data-driven briefs
4. Agent 5 (Monetisation Optimizer) — add once traffic is flowing and there's data to act on
5. Agent 6 (Distribution) — add once content and rankings are stable

### The hardest problem: voice drift

Getting Gemini to write in a specific voice consistently across hundreds of articles without drifting into generic AI patterns is harder than content generation itself. Each site needs a system prompt with 20+ specific voice rules: banned phrases, preferred structures, tone descriptors, example sentences. Budget time to build and refine these — they directly affect Google's quality assessment of your content.

## 8. Monetisation Strategy

Three revenue streams that compound

### Revenue stream 1: Affiliate commissions

The primary long-term revenue driver. Every tool listed on every site should have an affiliate link. SaaS tools in these niches pay 20–40% recurring commissions — meaning one referred customer paying \$99/month generates \$19–40/month for the life of their subscription.

| Program                         | Commission structure                    |
|---------------------------------|-----------------------------------------|
| Jasper AI                       | ~\$96/year per referral (recurring 30%) |
| Zapier                          | ~\$50–200/year per referral             |
| Bubble                          | ~\$40–150/year per referral             |
| Webflow                         | ~\$48–200/year per referral             |
| Notion (via affiliate networks) | One-time but high volume                |
| Airtable                        | Available via Impact network            |
| Make (formerly Integromat)      | 30% recurring                           |
| Framer                          | 20–30% recurring                        |

Apply to: ShareASale, Impact, PartnerStack, CJ Affiliate. Some take 2–4 weeks to approve. Apply now, before you need the links.

### Revenue stream 2: Sponsored listings

The fastest path to real cash — you can sell these before you have significant traffic if the site looks professional. Tool makers pay for visibility in front of their target audience. With 3 slots per site × 10 sites = 30 potential slots.

| Traffic level                       | Sponsored slot pricing   |
|-------------------------------------|--------------------------|
| 0–2,000 visitors/month              | \$99–199/slot/month      |
| 2,000–10,000/month                  | \$199–499/slot/month     |
| 10,000–50,000/month                 | \$499–1,000/slot/month   |
| 50,000+/month                       | \$1,000–2,500/slot/month |
| Network-wide package (all 10 sites) | \$5,000–15,000/month     |

Cold email 10 small AI/no-code tool companies in week 2. Subject line: 'Sponsored listing on [SiteName] — [niche] audience'. Even 2 saying yes at \$149/month = \$298/month before you have meaningful traffic.

## Revenue stream 3: Display advertising

Passive, scales with traffic. Mediavine requires 50,000 sessions/month minimum; Raptive (formerly AdThrive) requires 100,000 pageviews. RPM (revenue per 1,000 visitors) in tech/software niches runs \$15–35. At 500,000 monthly visitors across the network that's \$7,500–17,500/month additional — fully passive.

| Network        | Notes                                                                       |
|----------------|-----------------------------------------------------------------------------|
| Google AdSense | Available immediately. Low RPM (\$2–8). Use only until Mediavine threshold. |
| Mediavine      | 50k sessions/month minimum. RPM \$15–25. Apply per site individually.       |
| Raptive        | 100k pageviews/month minimum. RPM \$20–35. Premium tech niche rates.        |

## 9. Income Projections

Conservative, realistic &  
optimistic

Three scenarios based on quality of execution, expired domain quality, and whether Google algorithm updates impact the network. All figures assume 10 sites running autonomous content at 4 articles/day each.

### Conservative scenario

Reasonable execution, 1–2 sites underperform, one algo update causes temporary traffic drop.

| Timeframe | Monthly Traffic       | Monthly Income  |
|-----------|-----------------------|-----------------|
| Month 1–2 | 2,000–5,000/month     | \$200–600       |
| Month 3–4 | 15,000–30,000/month   | \$1,500–4,000   |
| Month 6   | 60,000–100,000/month  | \$6,000–12,000  |
| Month 12  | 200,000–350,000/month | \$20,000–35,000 |
| Month 18  | 400,000–600,000/month | \$40,000–65,000 |

### Realistic scenario

Strong execution, quality gateway genuinely enforced, expired domains relevant and clean.

| Timeframe | Monthly Traffic         | Monthly Income    |
|-----------|-------------------------|-------------------|
| Month 1–2 | 5,000–12,000/month      | \$500–1,500       |
| Month 3–4 | 30,000–60,000/month     | \$4,000–9,000     |
| Month 6   | 120,000–200,000/month   | \$15,000–28,000   |
| Month 12  | 500,000–800,000/month   | \$55,000–90,000   |
| Month 18  | 900,000–1,500,000/month | \$100,000–160,000 |

### Optimistic scenario

Everything clicks, no major algo hits, sponsored listings fill quickly, premium affiliate deals.

| Timeframe | Monthly Traffic         | Monthly Income   |
|-----------|-------------------------|------------------|
| Month 6   | 250,000–400,000/month   | \$30,000–55,000  |
| Month 12  | 800,000–1,400,000/month | \$90,000–150,000 |

| Timeframe | Monthly Traffic  | Monthly Income     |
|-----------|------------------|--------------------|
| Month 18  | 2,000,000+/month | \$200,000–300,000+ |

## How the month 12 realistic number is built

At 500,000 monthly network visitors, with 0.4% effective affiliate conversion and average \$35 commission: \$70,000/month. Sponsored listings at \$500–1,500/slot across 10 sites with 3 slots each: \$15,000–45,000/month. Display ads at \$20 RPM: \$10,000/month. Total: \$95,000–125,000/month gross. After \$700/month running costs: \$94,300–124,300/month net. The realistic midpoint sits at \$55,000–90,000/month because not all sites perform equally and not all affiliate slots convert optimally.

## 10. Acquisition Value

The exit opportunity

Content site networks in these niches sell for 35–45× monthly net profit on platforms like Flippa and Motion Invest, or through brokers like Quiet Light and Empire Flippers. The multiple reflects the passive, scalable nature of the asset.

| Profit level                                      | Estimated acquisition value |
|---------------------------------------------------|-----------------------------|
| \$10,000/month net profit (month 12 conservative) | \$350,000–450,000           |
| \$40,000/month net profit (month 12 realistic)    | \$1,400,000–1,800,000       |
| \$80,000/month net profit (month 18 realistic)    | \$2,800,000–3,600,000       |
| \$150,000/month net profit (month 18 optimistic)  | \$5,250,000–6,750,000       |

### The 18-month path to a \$2M+ exit

18 months of consistent execution — not passive, but manageable at 15–20 hours/week with the agent swarm handling operations — produces an asset worth \$2M–4M on the open market. Most buyers are private equity groups and individual operators who pay cash. Brokers take 10–15% commission. The net proceeds after a \$2.5M sale at 12% commission: \$2,200,000.

## What buyers look for (optimise for this from day one)

- Revenue diversification — at least 3 income streams, no single stream above 60% of total
- Traffic source diversification — organic SEO dominant, but social and direct traffic present
- Clean analytics history in Google Search Console and Analytics — no gaps, no suspicious spikes
- Documented, transferable systems — the agent swarm and content pipeline must be documented so a buyer can run it
- Upward trajectory — buyers pay premiums for sites still growing at time of sale; don't list when traffic peaks
- Clean affiliate relationships — all programs in good standing, no terms violations

## 11. Risk & Mitigation

What can go wrong and how to prevent it

### Google algorithm update

HIGH RISK

*Google makes 4–8 major updates/year. AI-content networks are a specific target.*

**Mitigation:** The quality gateway is your primary protection. Secondary: ensure each site has human-authored cornerstone content (1–2 flagship articles per site written manually), real author profiles, and genuine E-E-A-T signals like specific tool screenshots and personal testing notes.

### Content quality drift

HIGH RISK

*AI voice drift causes articles to gradually become generic and indistinguishable.*

**Mitigation:** Audit 10 random articles per site monthly. Rebuild system prompts quarterly. Add banned-phrase lists that grow over time as new patterns emerge.

### Footprint detection

MEDIUM RISK

*Google detects network patterns: shared IPs, identical structure, uniform linking.*

**Mitigation:** Separate Lovable projects, separate domains, separate nameservers, vary site designs, vary linking patterns. The Interlink Agent's link database enforces this.

### Expired domain penalty inheritance

MEDIUM RISK

*Purchased domain may have a hidden manual penalty or toxic backlink profile.*

**Mitigation:** Check archive.org history thoroughly. Run full backlink audit via Ahrefs before purchase. Use Google's disavow tool if toxic links discovered after purchase.

### API cost spikes

LOW RISK

*Gemini API pricing changes or a misconfigured pipeline causes unexpected costs.*

**Mitigation:** Set hard spending limits in Google AI Studio. Monitor weekly. The current cost structure is ~\$20/month for the full network — even a 10× spike is \$200/month, manageable.

### Operational burnout

MEDIUM RISK

*Managing 10 sites even with automation is not passive in the first 6 months.*

**Mitigation:** Build the agent swarm before scaling to 10 sites. Don't launch all 10 simultaneously — add 2–3 sites per month after the anchor site reaches 5,000 visitors. The swarm should absorb 80% of operational load by month 4.

### The principle: prove before you scale

Launch the anchor site to 5,000 monthly visitors before building any companion site. This gives you a proven template, real performance data, and a monetisation model that works — before you multiply it by 10. Trying to build all 10 simultaneously means 10 sites with zero traffic instead of 1 site with real momentum.

#### Week 1–2

#### Anchor site foundation

- Expand tool database from 8 → 30 listings (prioritise most-searched platforms first)
- Apply to all affiliate programs: ShareASale, Impact, PartnerStack, CJ Affiliate
- Verify Google Search Console connection; confirm article pipeline is publishing correctly
- Cold email 10 no-code tool companies offering sponsored listing slots (\$149–299/month)
- Set up Supabase database for cross-link logging (ready for Agent 3)
- Purchase first expired domain for anchor site (start ODYS.global or GoDaddy Auctions search now)

#### Week 3–4

#### Content momentum + first monetisation

- Expand to 50 tool listings with full reviews, pros/cons, and affiliate links on each
- Build Agent 3 (Interlink Architect) in n8n — configure Supabase link database
- Write 2–3 flagship cornerstone articles manually (these become your E-E-A-T anchors)
- Start posting article summaries on LinkedIn and relevant subreddits (r/nocode, r/entrepreneur)
- Monitor first affiliate clicks in dashboard — identify which tools are converting
- Begin expired domain research for first 3 companion sites

#### Month 2

#### Companion sites 2–4 + rank monitoring

- Launch AI Automation site, No-Code Backend site, and No-Code Ecommerce site
- Each launches with: 20+ tool listings, 10 seed articles, affiliate links configured, expired domain
- Build Agent 4 (Rank Monitor) — connect Nightwatch to all active sites
- First sponsored listing revenue should be arriving from anchor site outreach in weeks 1–2
- Apply for Mediavine on anchor site if approaching 50,000 sessions/month
- Begin outreach to relevant newsletters for backlink/mention opportunities

#### Month 3

#### Scale to 7 sites + keyword intelligence

- Launch AI Integration, Agency, and Analytics sites
- Build Agent 1 (Keyword Scout) — connect GSC API, configure brief generation
- Content pipeline now receiving data-driven briefs rather than generic topics
- Network traffic should be 30,000–100,000/month combined (depending on domain quality)
- First meaningful affiliate income: \$1,500–9,000/month

- Review voice audit: pull 10 random articles per site and check for drift

## Month 4–6

## Complete network + monetisation optimisation

- Launch final 3 sites: SaaS Founders, Design & UI, Solopreneurs
- Build Agent 5 (Monetisation Optimizer) and Agent 6 (Distribution Agent)
- Full 6-agent swarm operational — transition from builder to strategic director
- Raise sponsored listing prices as traffic grows; renegotiate affiliate deals for better rates
- Begin documenting all systems (for future sale due diligence)
- Network should be approaching \$6,000–28,000/month income

## The bottom line

You have already built the hardest part: a working autonomous content pipeline with a quality gateway. That puts you ahead of 95% of people attempting this. The technology to run a 10-site content empire on under \$500/month now exists and is no-code accessible. The agent swarm to operate it autonomously is buildable in 90 days. The income and acquisition numbers are real — they are what this model produces for operators who execute with discipline and resist the urge to scale before the foundation is proven. Build one great site first. Then multiply it.
